

CTSA Program KL2 Scholar in the News:

Improving epilepsy treatment by
optimizing pharmacotherapy and
understanding brain networks

- Learning what drugs to avoid for treating seizures in babies through preclinical modeling of long-term outcomes
- Mapping pathways in the brain that can explain how seizures propagate and where we can intervene

“While the long term goal of epilepsy research is “no seizures, no side effects”, we also aim to optimize decision making for currently available therapies.”

Patrick A. Forcelli, Ph.D.
